

Idea 1: (Useful Spring/Summer 2026 and annually) ML that used CIWP qualitative data to inform CO Strategic Plans

Problem: CO leaders have limited information about school needs and plans. Current information is largely outcome based or anecdotal. A few teams conduct surveys or systematic observations or interviews but those sources have various limitations. As a result, there remains some ongoing misalignment between CO support/resources and school needs and priorities.

User Story: Central Office (CO) directors, and above, use ML to gain efficiency in mining the **qualitative** data in SY27-SY29 school CIWPs to find trends* in the following:

- The Student Centered Problems schools are addressing in their next CIWP Cycle
- The trending Root Causes of these problems
- The strategies from school Theories and Action to address the root causes
- The specific Practice Goal measures schools are using to track the impact of the strategy on adult practice.

*CO users need to be able to mine the data for trends in their areas of expertise (math, early childhood, students with disabilities, ect).

Impact:

1. CO leaders with a clearer and more complete understanding of the work related to their department that schools have prioritized, equipping CO leaders to *proactively* design resources and supports to accelerate school implementation of their CIWPs for greater alignment between CO activity and school-level priorities.

Current State:

- We can see trends in the CIWP data that rolled up from dropdown inputs which is valuable but leaves other rich data source dependent on manual analysis from roughly 570 CIWPs
- ★ To help network teams with feedback for schools and future network planning, the ONS CI team has developed a new [Gem](#) that finds trends through multiple CIWPs. It analyzes the Student-Centered Problem, Root Cause, Theories of Action, and Practice Goals for a group of CIWPs and then provides trends (prevalence, strengths, and opportunities) in a simple format for network leaders. It has received positive feedback from multiple networks on the validity of the trends it identified. Here's [a network data set](#) that this Gem is designed for. We need a similar tool that provides reliable results for a *district-wide* version of the data set and responding to more nuanced prompts.

Idea 2: (Useful Summer 2028 to Spring 2029) ML to Inform SY30-SY32 CIWP Foundations and School CIWP Priorities

Problem:

1. Every 3 years CO leaders must establish the CIWP Foundations as well as related Practices around which schools reflect and set CIWP priorities as well as performance metrics around which schools goal set. This is a large undertaking and there is little bandwidth to do this based on comprehensive district-wide data analysis to inform areas for cross-functional alignment.
2. Every 3 years schools must reflect upon LARGE amounts of quantitative data AND collect stakeholder feedback related to *each* of the CIWP Foundations, currently 5. Reflecting on the data takes SO much time that school CIWP teams often have very limited time to...
 - a. thoroughly analyze all relevant data in a disaggregated manner
 - b. solicit and gather the stakeholder feedback necessary to ensure they identify high impact Student-Centered-Problems and *the* Root Cause

User Story:

1. Summer 2028: Central Office (CO) directors, and above, use ML to *support* efficient comprehensive district-wide data analysis to help identify district-wide performance challenges requiring prioritization and goal-setting at the school level.
2. Feb/March 2029: School CIWP Teams use ML to *support* efficient comprehensive school-wide performance data analysis to help identify school-wide performance challenges to consider for prioritization and goal-setting.

Impact:

1. SY30-SY32 CIWP Foundations, Practices and Goal metrics provided by CO in the CIWP template are more data informed
2. CIWP priorities and goals with a high impact aim, and no blind spots, based on...
 - a. more comprehensive data analysis made possible by efficiencies offered by ML
 - b. greater stakeholder engagement in the CIWP development process made possible by the efficiency named above

Current State:
